Objectives of the course

Mathematics and statistics are indispensable tools for economists. Without a thorough knowledge of mathematics and statistics it would be impossible to understand economics, econometrics, and finance. Economists use mathematics in their work as much if not more than physicists and other scientists. Without statistics, economics reduces to a bunch of stories that are not even amusing. The main objective of this course is to acquaint you with basic methods of mathematics and statistics and their use in economics and econometrics. In addition, knowledge of computational and statistical software is a must for economists. Many class assignments will involve using computational packages such as Matlab and SPSS.

Text

*Foundations of Mathematical and
Computational Economics,*
Thomson/South-Western, 2007

Mathematics, economics, and computation

(chapter 1)

Basic mathematical concepts

(chapter 2)

Introduction to probability theory

(chapter 3)

Vectors and matrices

(chapter 4)

Differentiation

(chapters 6 & 7)

Static optimization

(chapter 9)

Constrained Optimization

(chapter 10)

Probability distributions

(notes in class)

Sampling distributions

(notes in class)

Estimation

(notes in class)

Hypothesis Testing

(notes in class)

Regression

(notes in class and the website)

Taylor series and its applications

(chapter 8)

Advanced topics in matrix theory

(chapter 5)

Grades

Grades are determined on the following basis:

Homework	25%
Mid-Term	35%
Final	40%
Total	100%
